Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 63 contigs. The true order of the pieces is not known and their order in this sequence record is
Rives, M., Rojas, A., Rojubokan, I., Rolfe, M., Ruiz, S., Savery, G., Scherer, S., Sooth, T., Shochtari, N., Sisson, I., Sodergren, E., Sonaike, T., Sparks, A., Stanley, H., Stone, H., Sutton, A., Svatek, A., Tabor, P., Tamerisa, A., Tamerisa, K., Tang, H., Sutton, A., Tayor, C., Taylor, T., Telfrod, B., Thomas, N., Thomas, N., Tang, M., Usnasey, J., Tayor, C., Taylor, T., Telfrod, B., Thomas, N., Thomas, S., Wang, S., Wang, S., Ward-Moore, S., Warren, R., Washington, C., Watlington, S., Wullamson, A., Wleczyk, R., Wooden, S., Worley, K., Weistock, G., Williamson, A., Wleczyk, R., Wooden, S., Weistock, G., and Gibbs, R.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chemistry: Dye-terminator Big Dye: 100% of reads Assembly program: Phrap; version 0.990329 Consensus quality: 10687 bases at least Q40 Consensus quality: 113151 bases at least Q20

                                                                                                     The present sequence is given in a specification relating to a rate ganglioside GM_1-specific alphal-2fucosyltransferase protein. The protein or its cellular fraction is useful for synthesis of a molecule comprising Fucalphal-3dalbetal-3dalNac. a glycolipid, glycoprotein, glycolipoprotein or a free oligosaccharide comprising Fucalphal-2dalbetal-3dalNac. The method involves contacting alphal-2fucosyltransferase with GDP-fucose and a molecule or glycolipid, glycoprotein, glycolipoprotein or oligosaccharide having a terminal Galbetal-3dalNac group. It is also oligosaccharide having a terminal Galbetal-3dalNac group. It is also useful for synthesis of fucosyl-GM_1 by contacting the protein with GDP-fucose and ganglioside GM_1. The obtained glycoproteins, glycolipids and cligosaccharides are useful as nutritional compositions and fucosyl-GM_1 is useful for inducing an immunotherapeutic or immunosuppressive action against cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120

```

for producing

The invention relates to rat GMI-specific alphal-2fucosyltransferase
(alphal-2FucT) enzyme and its corresponding nucleic acid. This nucleic
acid is specific for a carbohydrate molety found in ganglioside GMI,
a terminal galactose betal-1N-acetylgalactosamine (Galbetal-3GalNAc)
acchaide. Alphal-2FucT DNA is useful for producing rat alphal-2FucT
protein by recombinant techniques. Alphal-2FucT DNA is useful for the
preparative synthesis of fucosyl containing glycolipids, glycoproteins,
glycolipoproteins and oligosaccharide, and for preparing fucosyl-GMI.
Alphal-2FucT DNA is useful for detecting oncogenic transformation which
involves assaying for changes in expression of alphal-2 FucT. Since
alphal-2FucT is activated in cell transformation, antisense sequences
dcrived from alphal-2FucT DNA is useful in gene therapy and
cor treating cancer. Alphal-2FucT DNA is useful in gene therapy and Rat hepatoma H35 cell alphal-2fucosyltransferase, useful for producing GMI-specific alphal-2fucosyltransferase enzyme by recombinant techniques and for detecting oncogenic transformation of test tissues AACGACTGGATGGAGGAGCGTTACCGCCACATTCCGGGACACTTTGTGCGCCTTCACGGGA Claim 1; Fig 5; 41pp; English.                                                                                                                                                                                                                   ŏ
                                                                                                                                                                                                                                                                                                               The present sequence is given in a specification relating to a rat gauglioside GM 1-specific alphal-2fucosyltransferase protein. The protein or its cellular fraction is useful for synthesis of a molecule comprising Fucalphal-2Gabbetal-3GalNac, a glycolipid, glycoprotein, glycolipid or a free oligosacharide comprising Fucalphal-2Gabbetal-3GalNac, and a molecule or glycolipid, glycoprotein, glycolipoprotein or and a molecule or glycolipid, glycoprotein, glycolipoprotein or oligosaccharide having alphal-2fucosyltransferase with GDP-fucose unseful for synthesis of fucosyl-GM_1 by contacting the protein with GDP-fucose and ganglicate GML. The obtained glycoproteins, glycolipids and cligosaccharides are useful as nutritional compositions and fucosyl-GM_1 is useful for inducing an immunotherapeutic or immunosuppressive action against cancer, neurological disease or small cell lung carcinoma.
                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                               201

The invention relates to rat GMI-specific alphal-2fucosyltransferase (alphal-2FucT) enzyme and its corresponding nucleic acid. This nucleic acid is specific for a carbohydrate molety found in ganglicaside GMI, a terminal galactose betal-3W-acetylgalactosamine (Galbetal-3GalNAc) saccharide. Alphal-2FucT DNA is useful for producing rat alphal-2FucT protein by recombinant techniques. Alphal-2FucT DNA is useful for the preparative synthesis of fucosyl containing glycolipids, glycoproteins, glycolipoproteins and oligosaccharide, and for preparing fucosyl-GMI.

Alphal-2FucT DNA is useful for detecting oncogenic transformation which involves assaying for changes in expression of alphal-2 FucT since alphal-2FucT DNA is useful for detecting oncogenic transformation which involves assaying for changes in expression of alphal-2 FucT since alphal-2FucT DNA are useful for inhibiting, suppressing cor treating cancer. Albhal-2FucT DNA is useful in gene therapy and antisense therapy. The present sequence is rat hepatoma H35 cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TACCACCACCTGCGCCCCAGAGATCCTGAAGGAGTTCACCCTGCATGACCACGTGCGGGAG 561

It was isolated from a pig liver genomic library using full-length human Se2 (FUT2) cDNA as probe. The nucleotide sequence shows about 36% nucleic acid, such as porcine Se nucleic acid, into a tissue results in reduced expression of unwanted carbohydrate epitopes on GCAAAAGGAGTCACTTGTTACGTCGCAGGAAGAGCCTTCTGATGGGAA 1149 Nucleic acid encoding glycosyltransferase able to compete with second such enzyme - particularly used to reduce expression of unwanted carbohydrate epitope(s) on tissues intended for 1021 GCAAAAGGAGTCACTTGTTACGTCGCAGGAAGAGCCTTCTGATGGGAA 1068 Secretor; glycosyltransferase; FUI2; pig; epitope; antigen; transgenic animal; xenotransplantation; organ transplant; s Porcine secretor transferase (FUT2) gene.                                                                                                                                                                                                                                                                                                                                                                           Gaps
the tissue, especially porcine heart, liver, kidney or pancreas, rendering it more suitable for transplantation, i.e. less immunogenic and of increased immunological acceptability. A claimed method of producing a cell from a donor species that is immunologically acceptable to a recipient species involves reducing levels of carbohydrate on the donor cell that causes it to be recognised as non-self by the recipient by causing a nucleic acid for a glycosyltransferase such as Se to be expressed in the cell. Expression units, such as retroviral packaging or produce cells, containing Se nucleic acids can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                  Score 630.2; DB 19; Length 1043:

Nucleic acids encoding chimeric glycosyltransferases - used for altering carbohydrate levels on the surface of cells, useful in therapy and transplantation

Example 2; Fig 6; 51pp; English.

The present sequence encodes pig secretor used in an example of the present invention. The present invention describes nucleic acids (NA) encoding a chimeric glycosyltransferase. The NAS comprise a caralytic domain of a first glycosyltransferase (GT) and a localisation signal of a second GT, whereby when the NA is expressed in a cell and where the chimeric enzyme is located in a marea of the cell where it is able to compete for substrate with a second GT, resulting in reduced levels of a product from the second GT. The NAS can be used to produce cells and organs with desired glycosylation patterns. Products and methods of the epitopes in cells, tissues or organs which may be used in transplantation or gene therapy.

The DNA encodes a alpha(1,2) fucosyltransferase and is the Secretor alpha(1,2) fucosyltransferase locus, that cross hybridises with the H blood group alpha(1,2)fucosyltransferase gene. The DNA is useful for producing a recombinant human GDP-L-fucose:beta-D-galactoside 2-alpha-L-fucosyltransferase (FUT2) which can be used for genotyping an individual as a secretor or nonsecretor as it is known that nonsecretors homozygous for a mutant allale of the FUT2 gene that has a stop codon in the position corresponding to amino acid 143.
                                                                                                                                                                                                                                Sec2; alpha(1,2) fucosyltransferase, H blood group; secretor genotyping; GDP-L-fucose:beta.D-galactoside 2-alpha-L-fucosyltransferase; human; FUT2; nonsecretor genotyping; ds.
